

AMAZON WEB SERVICES – HOSTING THE WEBITE

The website has been successfully deployed and is now live on an Amazon EC2 instance within the AWS cloud infrastructure. This setup ensures scalability, reliability, and secure access to the application. The deployment includes proper configuration of the server environment, network settings, and any necessary security groups or IAM roles to support production-level availability. Hosting the application on EC2 allows for greater control over the server and facilitates future scaling based on traffic demands.
